Maximum Sum

Prof. Edson Alves – UnB/FCTE

Problema

You are given a sequence $A[1], A[2], \ldots, A[N]$ ($0 \le A[i] \le 10^8$, $2 \le N \le 10^5$). There are two types of operations and they are defined as follows:

Update:

This will be indicated in the input by a 'U' followed by space and then two integers i and x.

U i **x**, $1 \le i \le N$, and x, $0 \le x \le 10^8$.

This operation sets the value of A[i] to x.

Query:

This will be indicated in the input by a 'Q' followed by a single space and then two integers x and y.

Q x y,
$$1 \le x < y \le N$$
.

You must find i and j such that $x \le i, j \le y$ and $i \ne j$, such that the sum A[i] + A[j] is maximized. Print the sum A[i] + A[j].

1

Entrada e saída

Input

The first line of input consists of an integer N representing the length of the sequence. Next line consists of N space separated integers A[i]. Next line contains an integer $Q,Q \leq 10^5$, representing the number of operations. Next Q lines contain the operations.

Output

Output the maximum sum mentioned above, in a separate line, for each Query.

Solução

- \blacksquare Um algoritmo *naive*, que percorre o intervalo [x,y] em busca destes valores tem complexidade O(QN) no pior caso, o que leva ao TLE
- lacktriangledown Para melhorar esta complexidade, observe primeiro que os índices i,j que maximizam a soma A[i]+A[j] correspondem aos dois maiores elementos no intervalo [x,y]
- Assim, pode-se utilizar uma árvore de segmentos para manter, para cada intervalo, os valores de seus dois maiores elementos
- Nas folhas, devem ser armazenados os pares (A[i], 0)
- Em cada nó, é preciso avaliar os pares armazenados nos filhos à esquerda e à direita, e escolher dentre eles os dois maiores
- Esta solução terá complexidade $O(Q\log N)$ no pior caso, de modo que a solução será aceita
